

JavaScript: Essential Concepts and Techniques

Master key JavaScript features with practical examples and real-world applications.

We'll explore built-in objects, dates, RegularExpression, events, and more to enhance your web development skills.

ISTM-Web Base Programming

T by Taukir Alam

Built-in Objects and Date Handling

Math Object

Generate random numbers with `Math.random()`. Round with `Math.floor()`. Access constants like `Math.PI`.

String Methods

Transform text with `.toLowerCase()`. Extract portions using `.slice()`. Substitute text via `.replace()`.

Date Objects

Create timestamps with `new Date()`. Extract year with `getFullYear()`. Get month using `getMonth()`.

Date Object

Components and Applications of JavaScript Date Object

Creating a Date

The method to instantiate date objects

Formatting Dates

Techniques to display dates in various formats

Manipulating Dates

Methods for altering date values

Practical Applications

Real-world uses like countdown timers

Exception Handling

Resilient Applications

Prevents crashes effectively

Complexity in Implementation

Can be challenging for beginners

Misuse of Constructs

Can lead to poor error handling

Improved User Trust

Builds confidence in applications

Regular Expressions and Exception Handling

RegExp Patterns

Create patterns using the `/pattern/` syntax to match specific text formats.

```
const emailPattern = /^@w+@w+.\w{2,3}$/;  
emailPattern.test("user@example.com");
```

Error Handling

Catch errors gracefully with `try...catch` blocks.

```
try {  
  // Risky code here  
} catch (error) {  
  console.log(error.message);  
}
```

Form Validation and Event Handling

Capture Input

Get form data using `getElementById()` or `querySelector()`.

Validate Format

Test input against regex patterns with `test()` method.

Prevent Submission

Use `event.preventDefault()` to stop invalid submissions.

Provide Feedback

Display error messages for invalid inputs.

Interactive Elements: Image Slider and Drag & Drop

1

Image Slider

Use `setInterval()` to rotate through images automatically.

2

Event Binding

Attach click events to navigation buttons for manual control.

3

Drag & Drop

Implement `dragstart`, `dragover`, and `drop` events for interactive UIs.

4

Position Tracking

Track mouse position with `mousemove` for precise control.

Advanced Array Methods and Functions

Push Method

Add elements to the end of arrays with
`array.push()`

Arrow Functions

Write concise code with `() => {}` syntax

Map Method

Transform each array element with
`array.map()`

Function Types

Choose between declarations and
expressions for different needs

Putting It All Together: Real-World Application

Best Practices and Further Learning

Modular Code

Separate concerns into reusable modules. Improves maintenance and testing.

Performance

Optimize loops and DOM operations. Minimize reflows and repaints.

Debugging

Use console methods and breakpoints. Learn browser developer tools.
